# PPM HYDRAULIC PRESSBRAKES

# PPM

## Hydraulic pressbrakes

Our long experience in producing hydraulic pressbrakes, as well conventional as CNC controlled, enables us to bring to our customers a solid engineered, high quality and most of all an economical affordable pressbrake. Our PPM pressbrakes can easily be adapted to the specific needs of our customer offering a wide range of tooling and backgauges.

### Unique positive depth setting

The PPM machine has a unique design with mechanical positive depth stops incorporated in the hydraulic cylinders for very accurate depth stroke adjustment (0.01 mm). Motorised adjustment controlled by 2 pushbuttons and electronic read-out conveniently located at the pendant control station.

### Standard features

- Mechanical equilibration by means of a heavy-duty solid anti-torsion bar.
- Mechanical depth stops incorporated in the cylinders for long life.
- Pendant control panel.
- Infinitely motorised depth adjustment by 2 pushbuttons from the control panel with electronic read-out.
- Easy infinitely adjustable ram stroke.
- Adjustable open height.
- Adjustable speed change-over point.
- Pressure control with electronic adjustment and read-out.
- Manual (jog mode) and automatic cycle selector switch.
- Movable foot pedal control.
- Short sectional tool holders to secure tool clamping.
- Filled oil tank.
- Instruction and maintenance manuals.
- Service tools.

### Options

- Safety fences and light curtains according to CE safety specifications.
- Motorised backgauge stroke.
- Standard stroke:
  - for 400 kN and 750 kN: 650 mm.
  - for other tonnages: 800 mm.
- Backgauge stroke up to 1000 mm.
- Central manual adjustable anti deflection tables.
- Frontstops.
- Different tooling configuration.
- Hydraulic top tool clamping.
- Groove for single V-dies.
- Hour meter.
- Stroke counter.

### Ram parallelism

Parallelism of the upper beam is maintained through an anti-torsion bar system. This solid torsion bar links both ends of the ram and maintains parallelism throughout the entire stroke even if off-centre loadings occur.

### Stroke adjustment

Adjustable mechanical cams at the operators side of the brake to set the upper position and work speed change point. In case of ATL550 control, an extra cam sets the retraction of the backgauge.

## Anti deflection tables

Angular variations caused by beam and table deformation can be compensated by the anti deflection table fitted directly onto the lower beam. It works by means of wedges moving progressively over each other, giving the table the desired crown in order to compensate for the beam and bed deflection. This results in a constant angular profile of the workpiece over the full working length of the machine. The anti deflection table can be set independently from the machine type or execution and in combination with different tool systems.

Anti deflection table for haco-dies.

Anti deflection table for system-dies.

## CNC control

### ATL550 (only up to 1500 kN)

Simple to programm basic control for conventional PPM pressbrake. Electronic digital readout of depth stop position and working pressure. Preselection mode: automatic positioning of backgauge and depth stop to the preselected position.

- Positioning of backgauge X - 0.1 mm.
- Positioning of depth stop Y - 0.01 mm.

Programming mode: possibility to make several programmes in which the backgauge and depthstop are positioned automatically after each step (bend).

- Programming X and Y (in depth only).
- Memory capacity: max. 200 programmes - max. 400 steps.

## Tooling

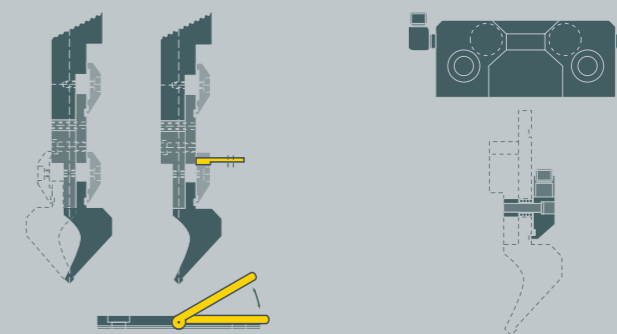

### Haco tooling

A budget friendly tool system specifically designed for each machine capacity. The multi V-die combines flexibility by having different V-openings into 1 die and easy tool turning. The top bending tool is available in different versions: flexible gooseneck tool 86°, straight tools of 86°, 30°, 60° or 180°, in full length or sectioned.

### System tooling

System tooling is available in a wide range of different bottom and top tools, to adapt the machine to almost any specific job. System tooling is manufactured to the smallest tolerances in standard lengths of 835 and 415mm so they can be put together to get bigger lengths. System bottom tooling in combination with an anti-deflection table results in a machine with the highest degree of accuracy.

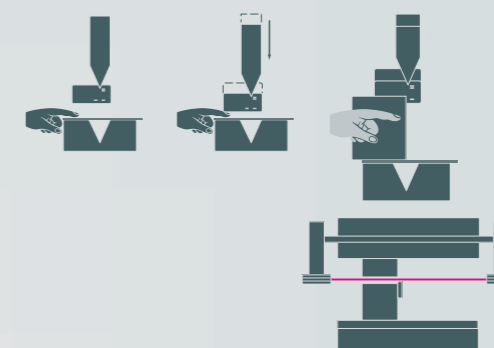

### Single V-dies

Single V-dies are available in a large variety of angles and V-openings. The small width/height ratio allows improved access for the workpiece around the die. Single V-die clamping uses a groove in either a Haco or a System tool table. By using the groove as a self alignment system, the toolchange can be reduced to very little time.

## Saffir

Machines according to CE specifications, are limited to working speed of 10 mm/s if operated with footpedal only. Working at fast approach speed is only possible with guarded working area. Saffir offers a solution by means of an optical system guarding the area around the punch.

## Technical specifications

Haco reserves the right to change any specifications without prior notice.

# Large sheetworking programme

## Hydraulic shears

Conventional and CNC controlled.  
Up to 32 mm.

## Hydraulic steelworkers

4 and 5 station universal steelworkers for punching, shearing flat, angle and bar cutting, notching. Up to 1600 kN.

## Angle notchers

Fix and variable angle.  
Up to 6 mm.

for impressive  
performances
